

ABSTRACT

The present invention provides agents for the prevention or treatment of intrauterine growth retardation or gestational toxicosis comprising as an active ingredient phenylethanol-aminotetralin derivatives represented by the formula (I) or pharmaceutically acceptable salts thereof such as a sulfate salt thereof, which exert a remarkable improving effect on fetal weight loss and static gangrene in the tip of fetal extremities and a remarkable improving effect on elevation of maternal urinary protein and plasma triglyceride level with ease of anxiety on palpitation of dams or the like.

Examples of administration forms include, for example, tablets, capsules, injections and so on. As diseases to be treated, for example, asymmetrical intrauterine growth retardation and hyperlipidemia associated with gestational toxicosis are specially preferable.
